

System Electronics

Co-pilot

As an output from the initial in context field visits to production facilities, the project team learned that facility managers, IT administrators and the workers along production lines would all greatly benefit if the multitude of interaction devices found in the industrial facility could be unified in one common control unit. Co-pilot with its compact design, a secure grip, comfortable access to the touch screen and easy transportability became the hardware platform for a new solution. With its easy to configure graphic user interface, Co-pilot allowed the various divisions of System spa to replace numerous uniquely designed interface units with a smaller number of mobile Wi-Fi control units that automatically configure in proximity to different receivers in logistic centers or along a production line.
